**Faculty Advisor:** Dr. Mohammad Shifat-E-Rabbi (MSRb)

## 1 SUMMARY

---

This week we focused on a comprehensive UI/UX modernization pass across the entire application — refining navigation, polishing the chat interface, streamlining medication management flows, improving the scan experience, and stabilizing the adherence tracker.

## 2 WORK COMPLETED

---

### 2.1 APP-WIDE UI MODERNIZATION

Replaced the default dissolve screen transitions with directional sliding animations that match the bottom navigation order. Added a glassmorphism effect (transparency + blur) to the bottom navigation bar. Cleaned the header layout by removing non-functional icons and optimizing spacing. Fixed the Home screen logo rendering and locked the app to portrait orientation. Improved edge-to-edge layout handling with proper WindowInsets configuration across all screens.

### 2.2 MEDICATION MANAGEMENT STREAMLINING

Rewrote the Medication Detail screen to support inline field editing via tap-to-edit popups, eliminating the separate Edit screen. Made dosage, dosage unit, and form fields optional across add/edit/detail flows. Improved metadata rendering in lists and detail headers to omit blank separators (e.g., showing "500 mg • Tablet" only when fields are populated). Added a Dosage Unit editor to the detail screen with smart clearing logic tied to the dosage field.

### 2.3 RxAIDE CHAT POLISH

Integrated official RxAide branding (app logo) into the chat header, bot reply avatars, and typing indicator. Fixed the input bar keyboard anchoring issue that left a gap above the on-screen keyboard. Centered the scan and send buttons vertically, reduced input bar padding, and updated the scan icon to a document scanner glyph. Wired the scan button to the camera screen. Redesigned image message bubbles to display at natural aspect ratio without cropping, and added

a full-screen image preview dialog with pinch-to-zoom and double-tap-to-zoom. Modernized all context menus (long-press on messages, three-dot menu) to match the app's neutral rounded design.

## **2.4 ADHERENCE TRACKER & DOSE SYSTEM REFINEMENTS**

Optimized the "by medication" adherence cards with a compact taken/total layout. Added a DoseGenerationWorker that backfills dose history records on app launch, ensuring records exist even when the app was not running. Implemented a global pull-to-refresh gesture to sync data across all screens. Fixed adherence history mapping to gracefully handle deleted medications.

## **2.5 ASSETS & ICONOGRAPHY**

Created a custom nasal spray vector icon and redesigned the capsule icon for better visual accuracy. Mapped all medication forms to their correct icon variants. Shrunk the adaptive app icon foreground for better framing across launcher shapes. Fixed top spacing on the Camera and Add Medication screens.

# **3 NEXT STEPS**

---

- Comprehensive end-to-end testing across diverse prescriptions and device configurations.
- Fix identified bugs.
- Final visual polish pass and performance optimization before submission.
